RegRipper

Registry analysis using RegRipper revealed critical forensic artifacts from the extracted hive. The `HKLM\SOFTWARE\...\Run` key indicated a suspicious executable configured for persistence, suggesting potential malware activity. The `HKCU\RecentDocs` key exposed recently accessed files, helping reconstruct user activity. Additional keys highlighted installed software and user account details. These artifacts collectively provide insights into system usage, possible compromise, and attacker persistence techniques, aiding in effective digital forensic investigation and incident response.

Registry Key	Value / Data	Forensic Significance
HKLM\SOFTWARE...\Run	malware.exe	Indicates persistence mechanism (auto-runs at startup)
HKCU\RecentDocs	File list	Shows recently accessed files (user activity tracking)
HKLM\SAM	User accounts	Contains user account details (authentication evidence)
HKLM\SOFTWARE\Microsoft...	Installed apps	Reveals installed software (possible malicious programs)
